| | | | | |
| | | | | |

NOTE: Capacity of the water supply is often determined more by available water storage, than by flow. Based on 20-year population and growth projections with an average per capita usage rate of 80 gpd, we want to demonstrate that existing water storage is more than sufficient for the planning horizon or we are recommending studies/expansion to address potential short falls. You may submit an alternative report that summarizes the above
